SPIKE TRIGGERED APPROACHES

Odelia Schwartz
Computational Neuroscience Course 2020

LINEAR NONLINEAR MODELS

 Often constrain to some form of Linear, Nonlinear computations, e.g. visual receptive fields or filters, followed by nonlinear interactions

LINEAR NONLINEAR MODELS

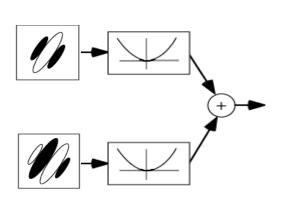

What type of nonlinearities?

DESCRIPTIVE MODELS: DIVISIVE NORMALIZATION

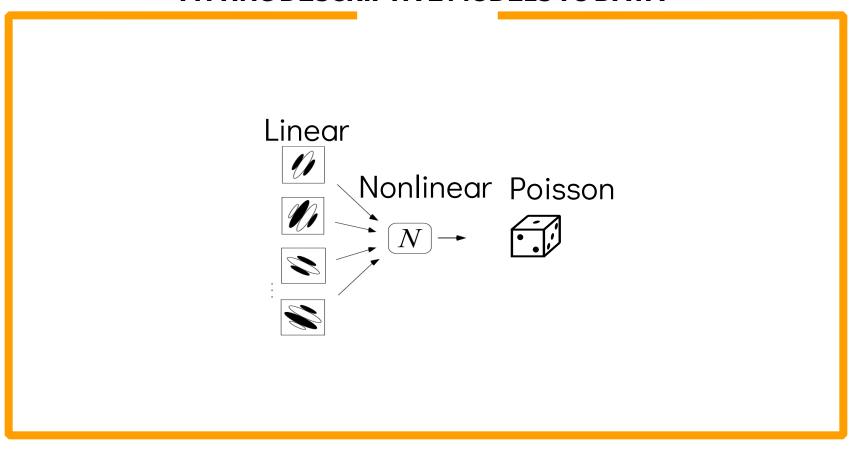

- o Canonical computation (Carandini, Heeger, 2013)
- Has been applied to primary visual cortex (V1)
- More broadly, to other systems and modalities, multimodal processing, value encoding, etc

DESCRIPTIVE MODELS: COMPLEX CELLS AND INVARIANCE

o after Adelson & Bergen, 1985

FITTING DESCRIPTIVE MODELS TO DATA

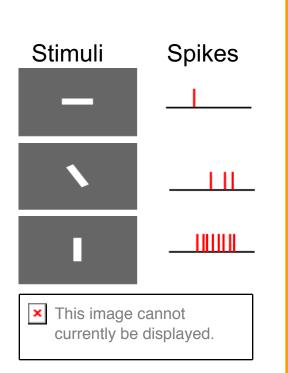

ROADMAP

- Simple cell traditional approach
- Simple cell (STA)
- When STA fails
- Complex cell (STC)
- Another example (STC)
- More generic model with multiple filters

REMINDER: RECEPTIVE FIELD

Hubel and Wiesel, 1959

REMINDER: RECEPTIVE FIELD

Primary Visual Cortex (V1)

RECEPTIVE FIELD

Filter Stimulus

= Positive response

Filter Stimulus

= Negative response

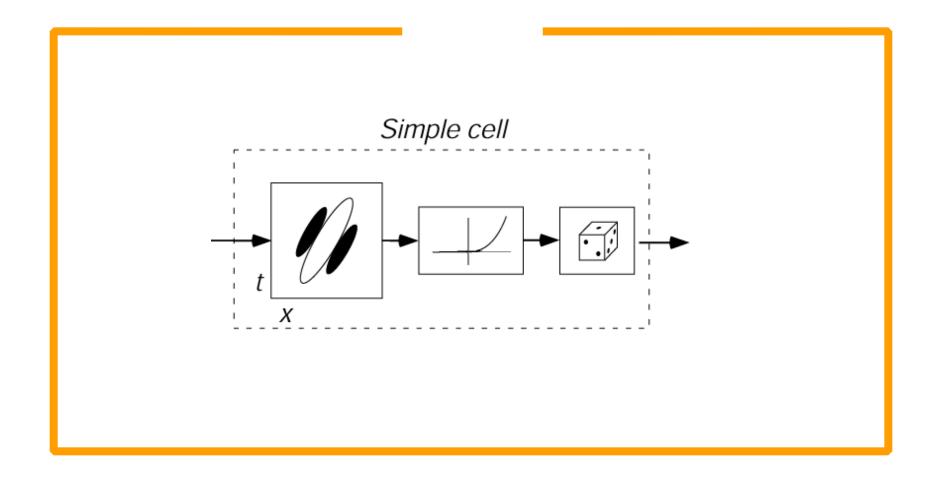

Filter Stimulus

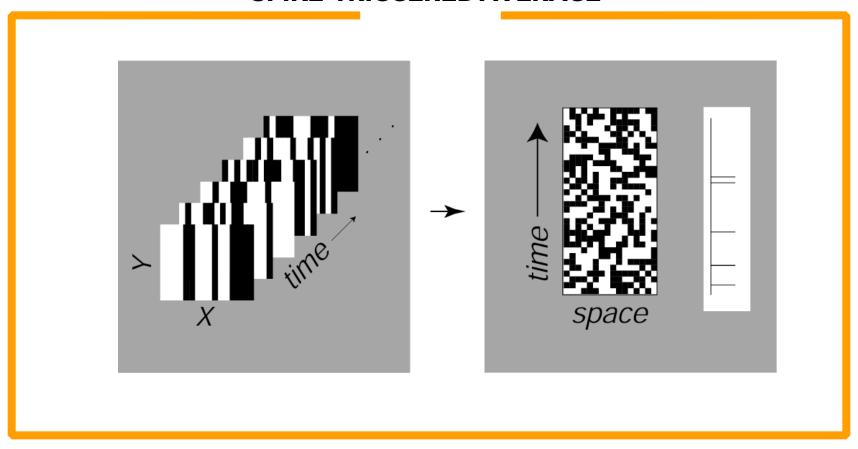

= Zero response

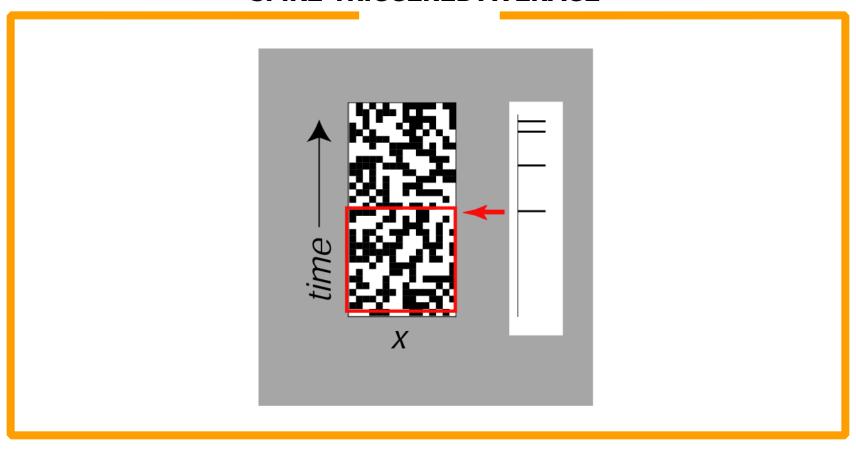

- o Response of a filter
 - = inner/dot product/projection of filter with stimulus

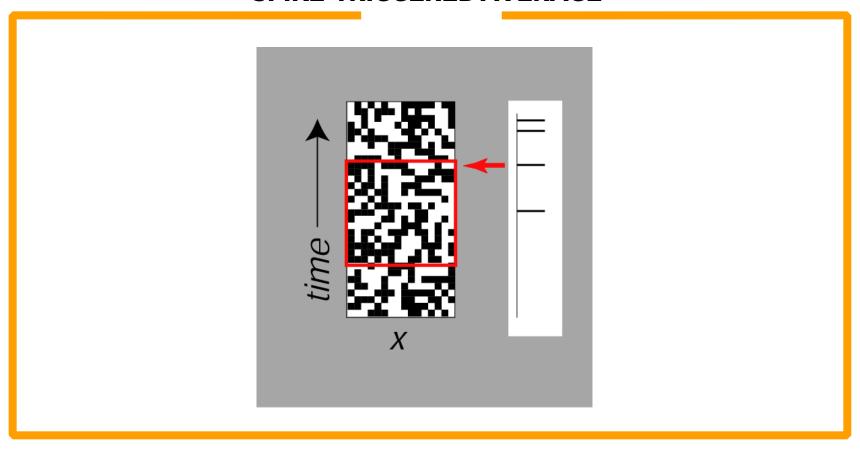

ROADMAP

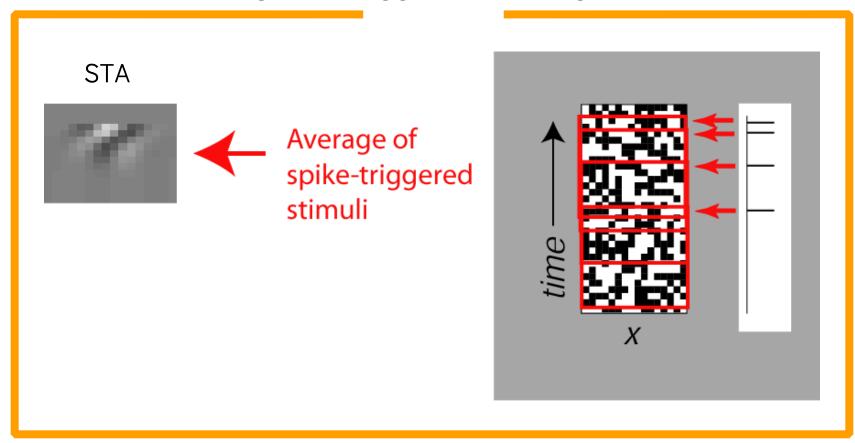

- Simple cell traditional approach
- o Simple cell (STA)
- When STA fails
- Complex cell (STC)
- Another example (STC)
- More generic model with multiple filters

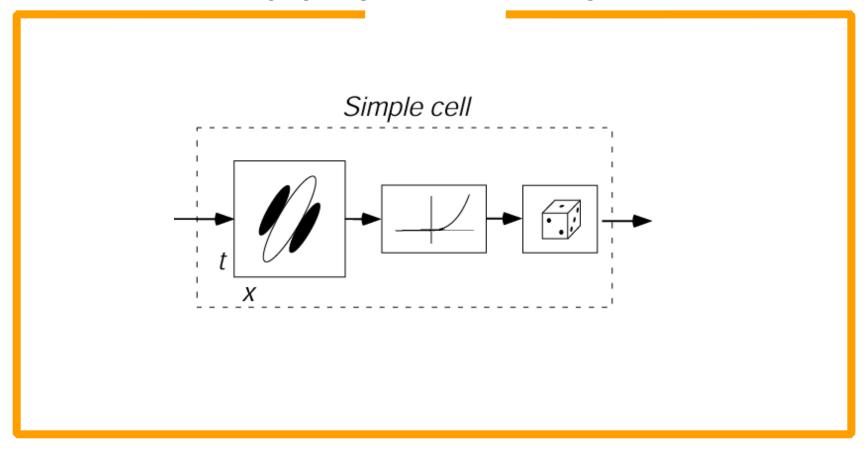

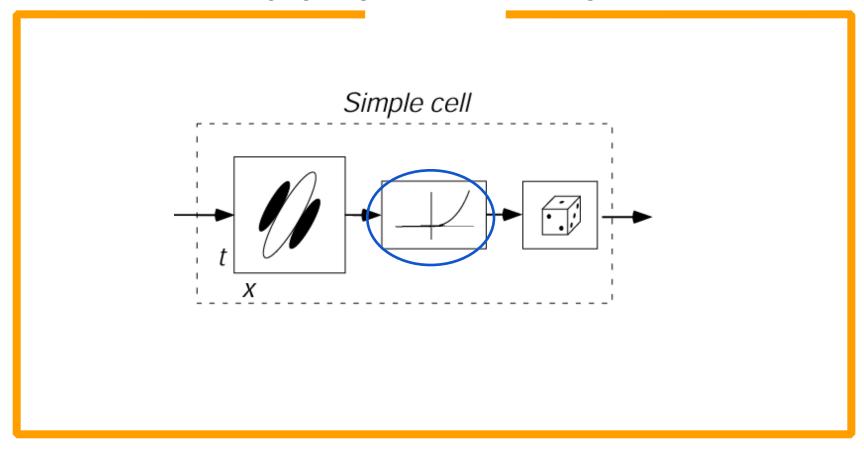

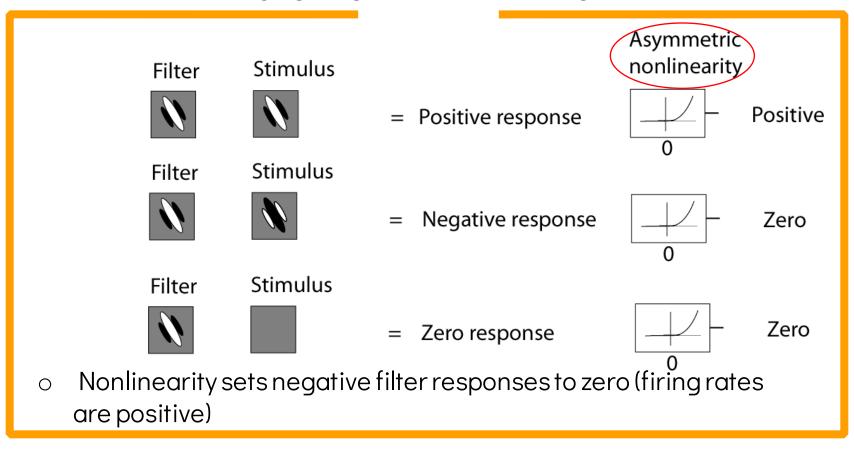

EFFECT OF NONLINEARITY IN MODEL?

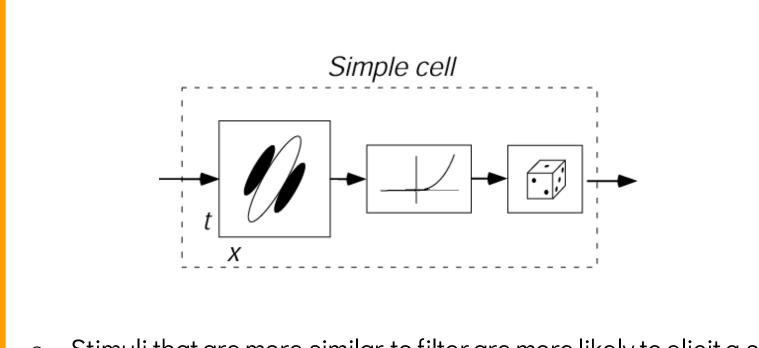

EFFECT OF NONLINEARITY IN MODEL?

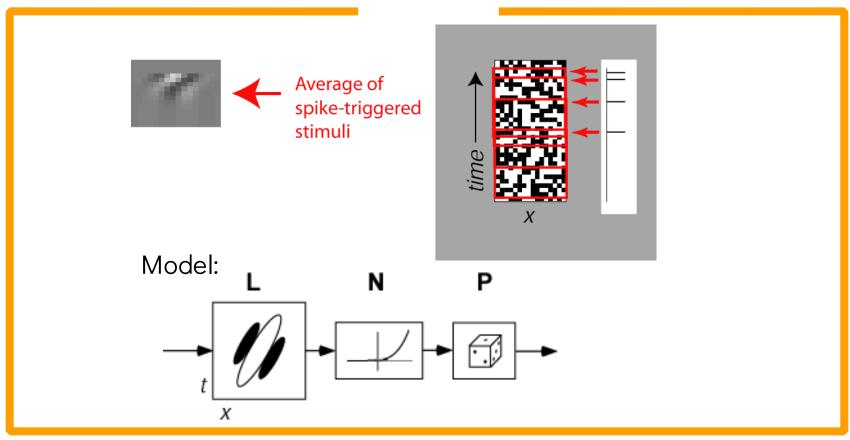

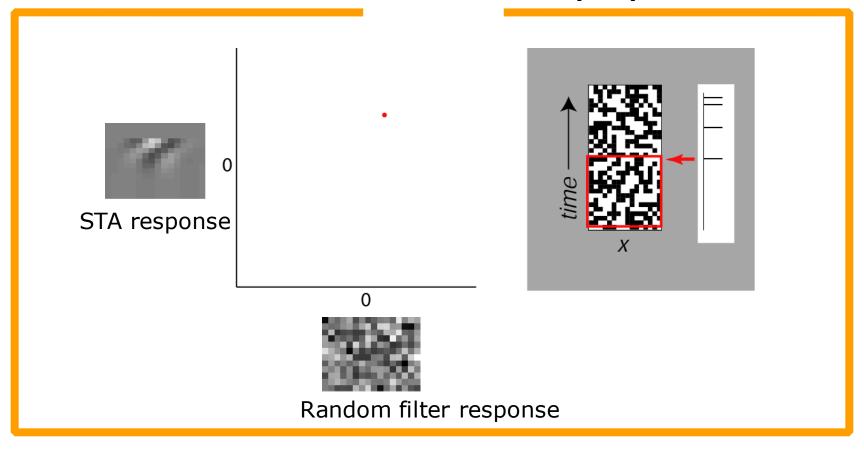

EFFECT OF NONLINEARITY IN MODEL?

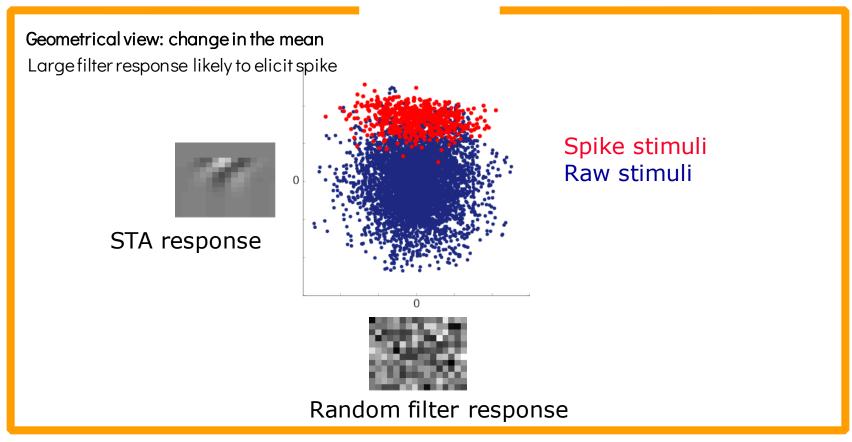

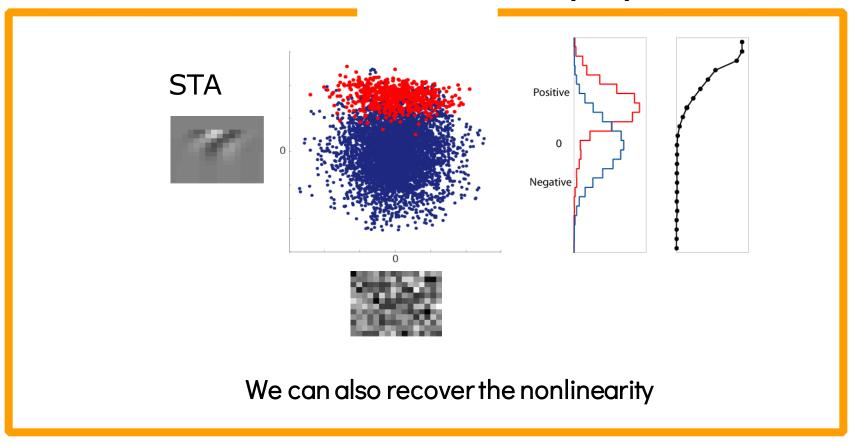

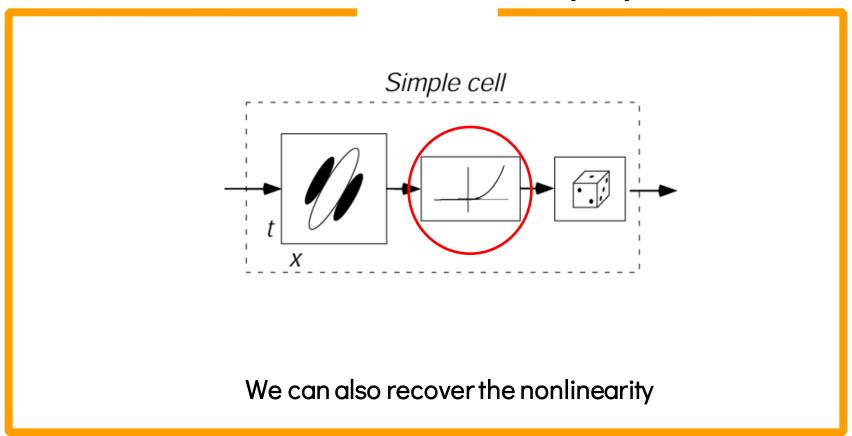

O Stimuli that are more similar to filter are more likely to elicit a spike...

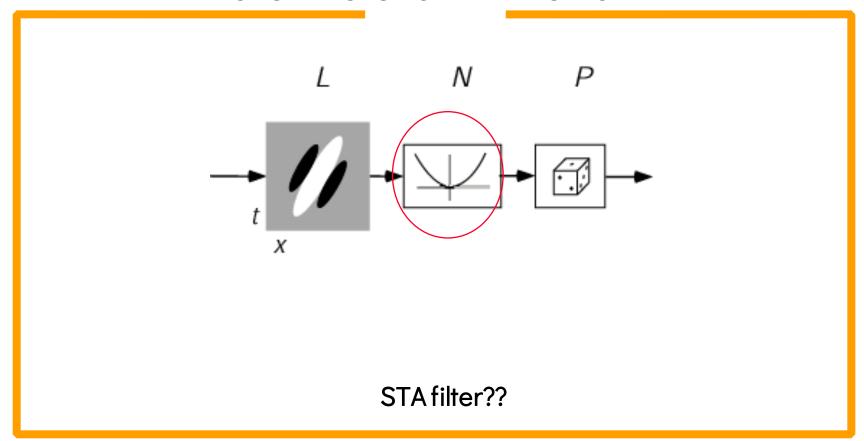

STEPS

- 1.Assume a model (filter/s, nonlinearity)(we assumed one filter and asymmetric nonlinearity)
- 2. Estimate model components (filter/s, nonlinearity) (we looked for changes in mean: STA)

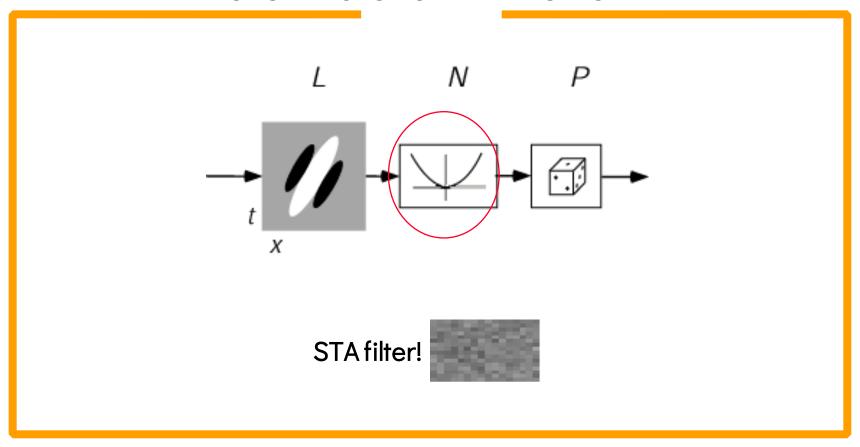

ROADMAP

- Simple cell traditional approach
- Simple cell (STA)
- When STA fails
- Complex cell (STC)
- Another example (STC)
- More generic model with multiple filters

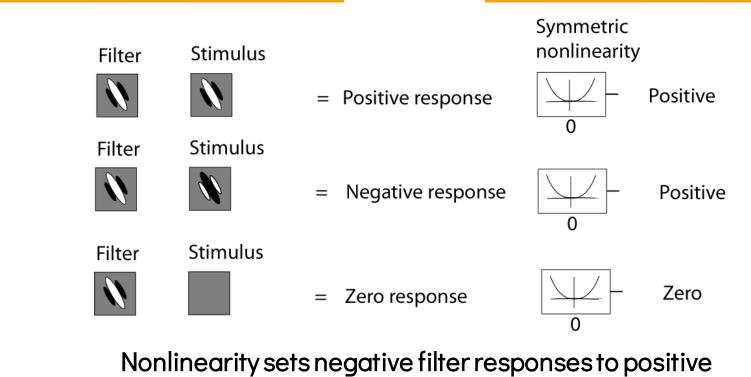

BUT STA DOES NOT ALWAYS WORK

BUT STA DOES NOT ALWAYS WORK

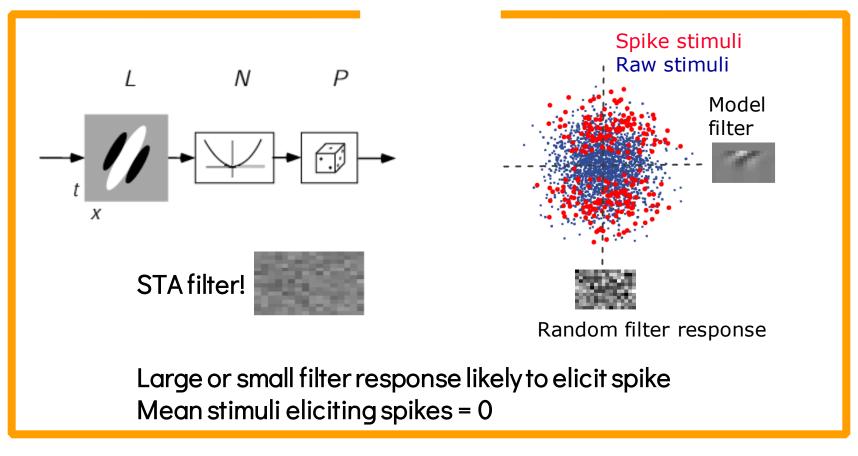

WHAT HAPPENED??

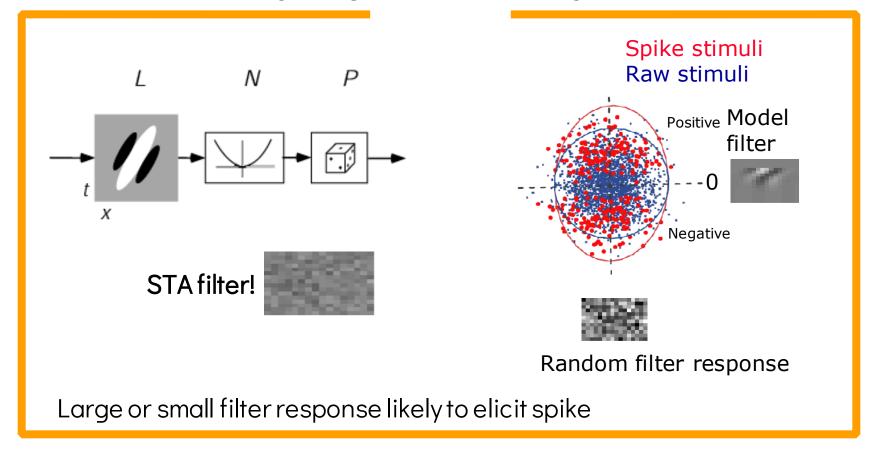

(firing rates are positive)

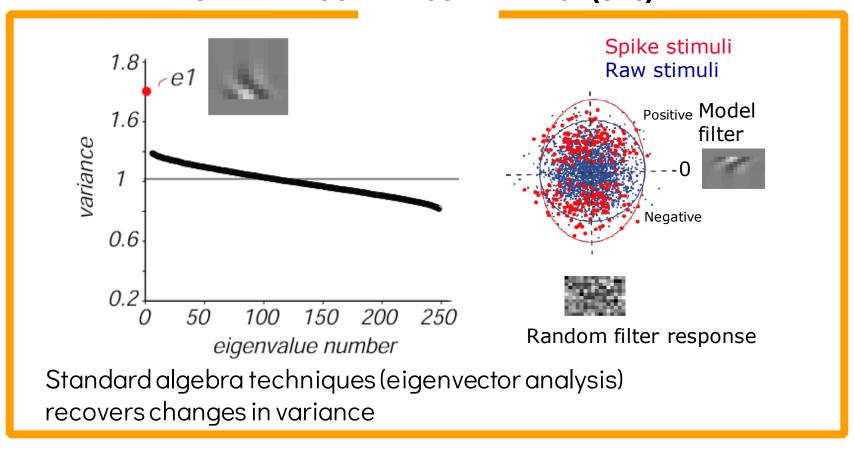

WHAT HAPPENED??

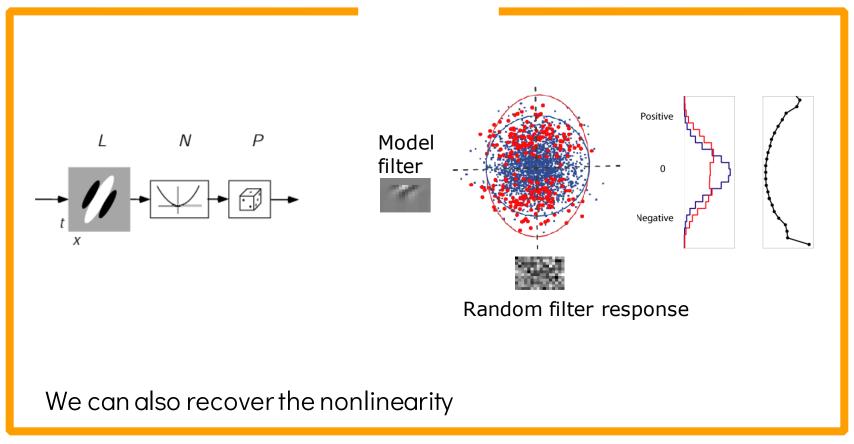

CHANGE IN THE VARIANCE

SPIKE-TRIGGERED COVARIANCE (STC)

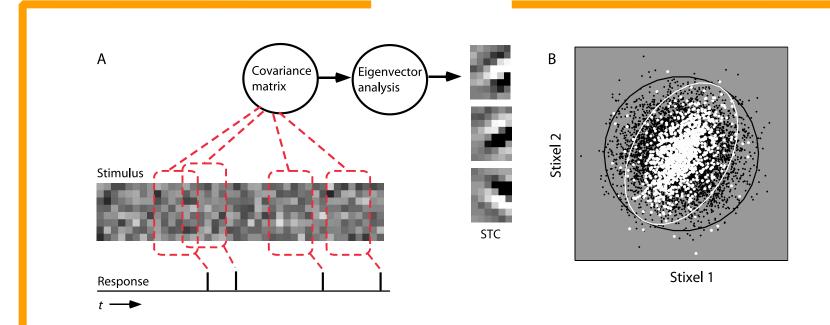

SPIKE-TRIGGERED COVARIANCE (STC)

STEPS

- 1.Assume a model (filter/s, nonlinearity) (we assumed one filter and symmetric nonlinearity)
- 2. Estimate model components (filter/s, nonlinearity)(STA failed)(we looked for changes in variance: STC)

SPIKE-TRIGGERED COVARIANCE (STC)

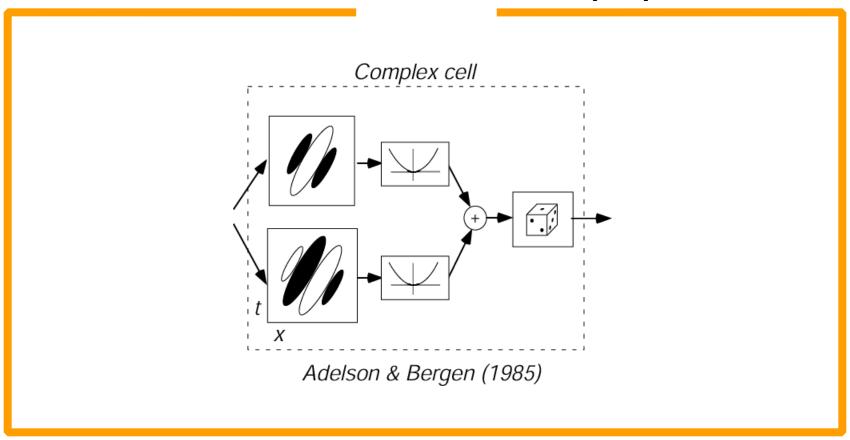

- o Figure from Schwartz et al. 2006; see also Rust et al. 2005, de Ruyter & Bialek 1988
- Approach estimates linear subspace and nonlinearity
- o (stixel = space time pixel)

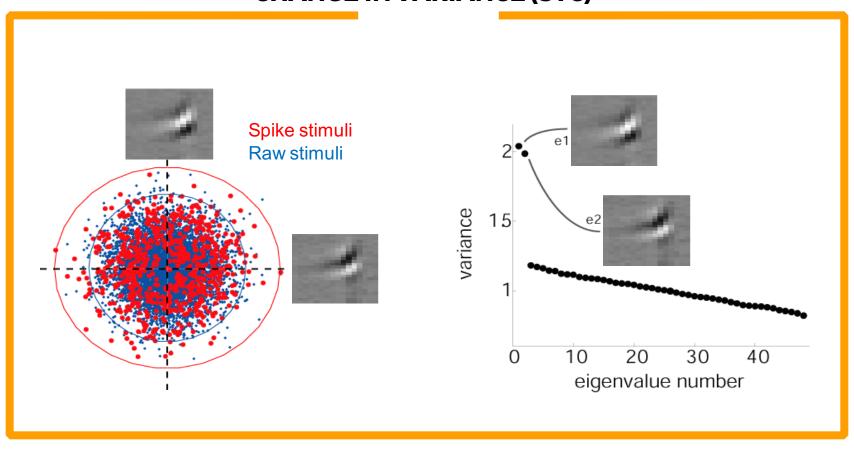

ROADMAP

- Simple cell traditional approach
- Simple cell (STA)
- When STA fails
- Complex cell (STC)
- Another example (STC)
- More generic model with multiple filters

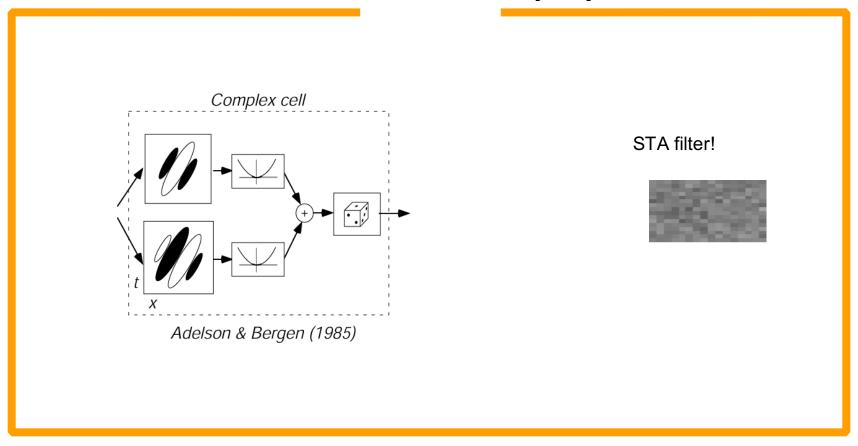

SPIKE-TRIGGERED COVARIANCE (STC)

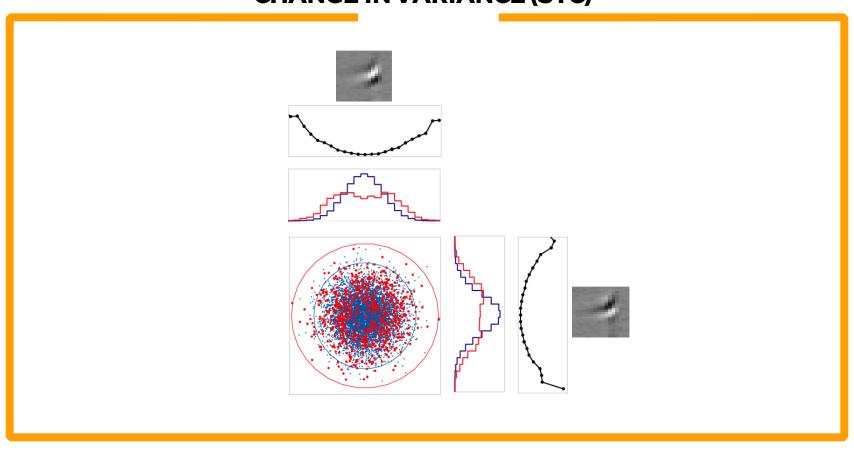

CHANGE IN VARIANCE (STC)

CHANGE IN VARIANCE (STC)

CHANGE IN VARIANCE (STC)

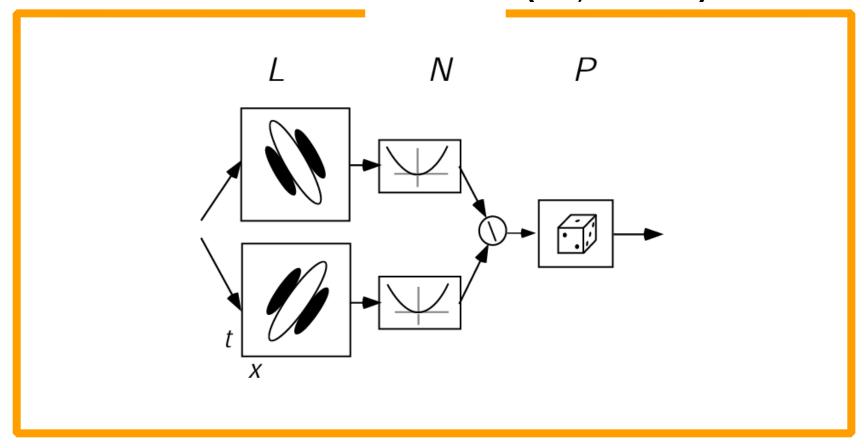

STEPS

- 1.Assume a model (filter/s, nonlinearity)(we assumed more than one filter and symmetric nonlinearity)
- 2. Estimate model components (filter/s, nonlinearity)(STA failed)(we looked for changes in variance: STC)

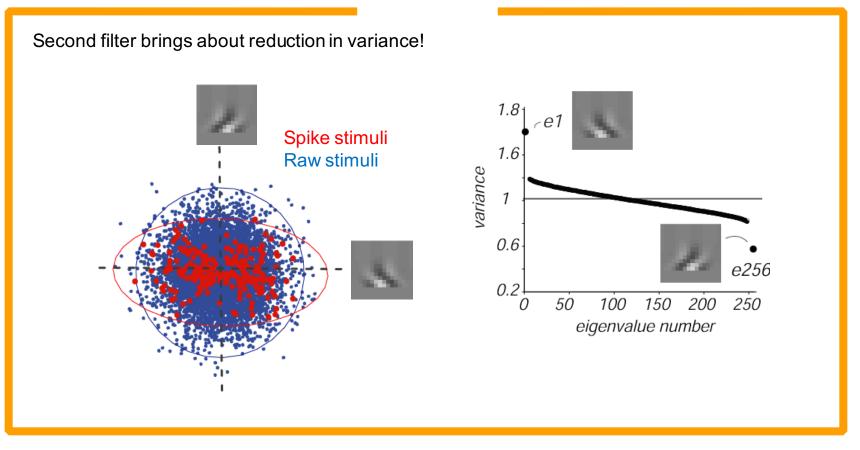

ROADMAP

- Simple cell traditional approach
- Simple cell (STA)
- When STA fails
- Complex cell (STC)
- Another example (STC)
- More generic model with multiple filters

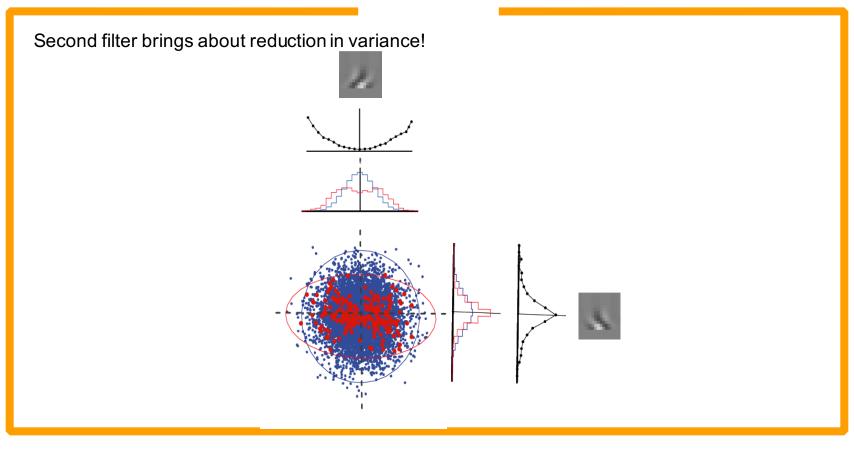

SECOND FILTER SUPPRESSIVE (E.G., DIVISIVE)

SECOND FILTER SUPPRESSIVE (E.G., DIVISIVE)

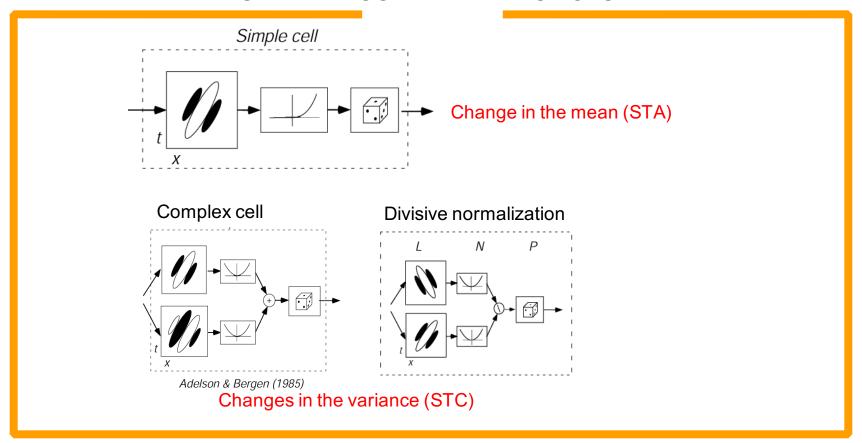

SECOND FILTER SUPPRESSIVE (E.G., DIVISIVE)

STEPS

- 1.Assume a model (filter/s, nonlinearity)
 (we assumed more than one filter and symmetric nonlinearity)
- 2. Estimate model components (filter/s, nonlinearity) (we looked for changes in variance, this time reduced variance: STC)

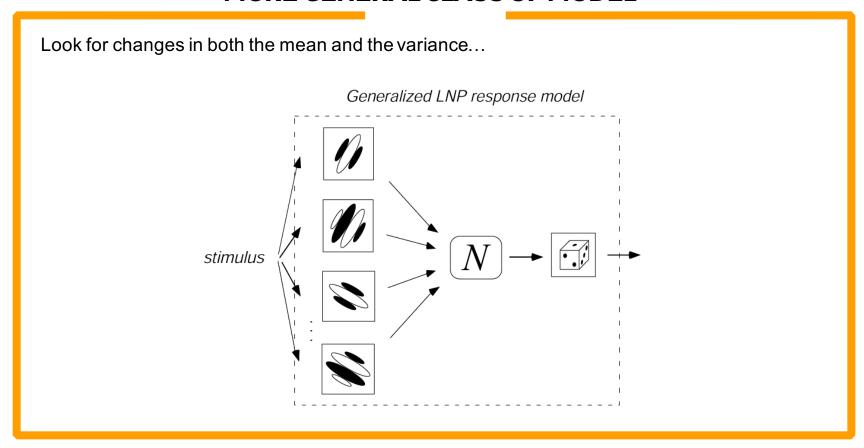

SPIKE TRIGGERED APPROACES

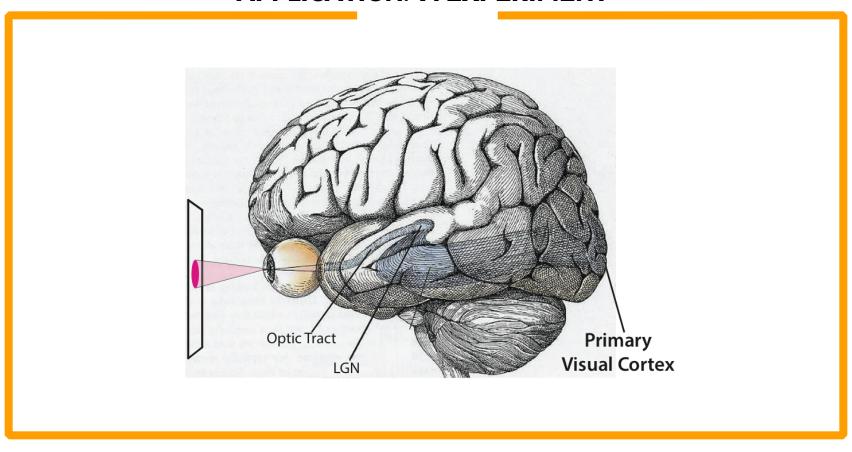

ROADMAP

- Simple cell traditional approach
- Simple cell (STA)
- When STA fails
- Complex cell (STC)
- Another example (STC)
- More generic model with multiple filters

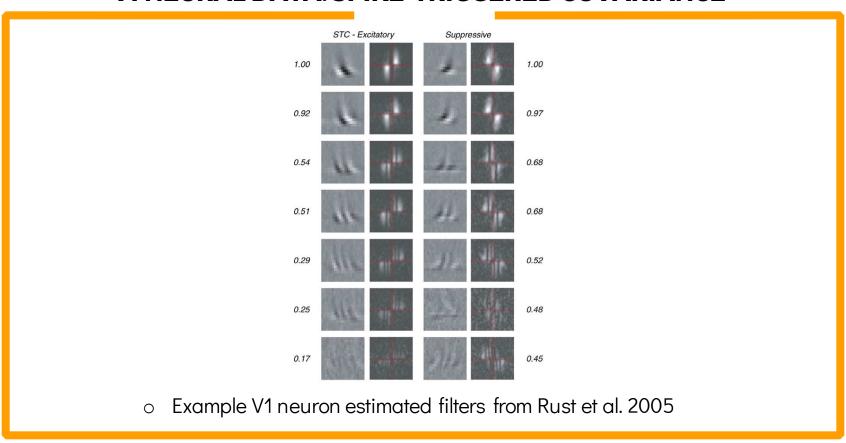

MORE GENERAL CLASS OF MODEL

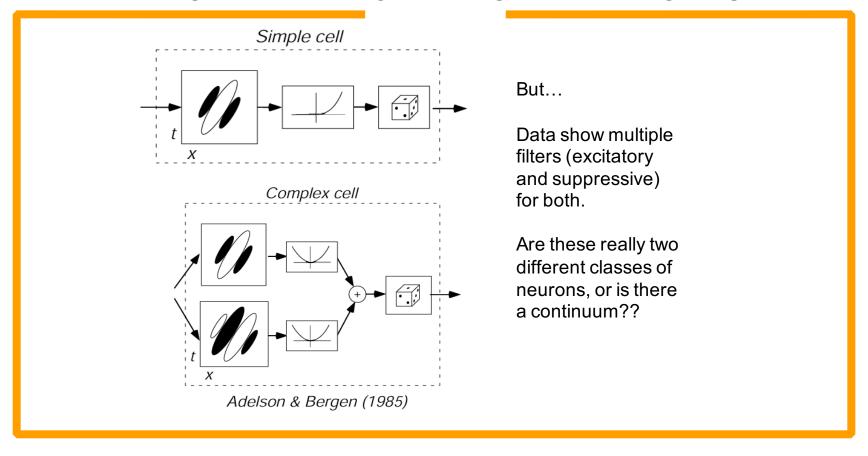

APPLICATION: VI EXPERIMENT

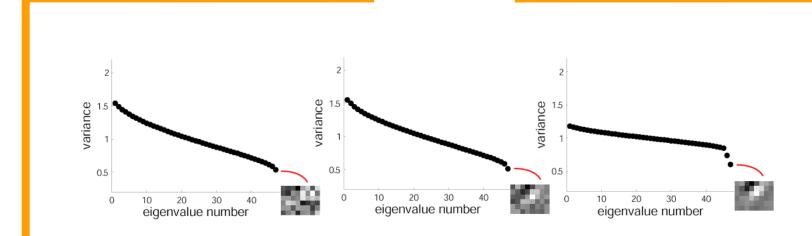

VI NEURAL DATA: SPIKE-TRIGGERED COVARIANCE

VI NEURAL DATA: RECALL THE STANDARD MODELS

STC ISSUES: HOW MANY SPIKES?

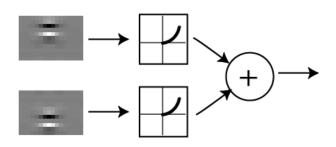

Filter estimate depends on:

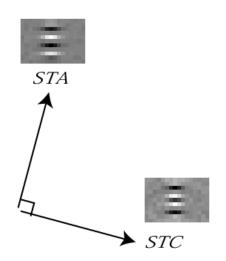

- Spatial and time dimensionality of input stimulus (smaller = better estimate)
- Number of spikes (more = better estimate)

STC CAVEATS

Analysis:

Model neuron:

 Analysis forces filters that are 90 degrees apart!
 Filters should not be taken literally as physiological mechanisms

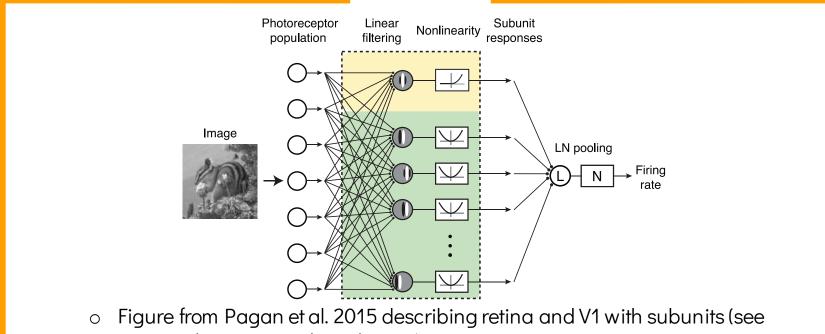

STC CAVEATS

Analysis: Model neuron: STA**≯** STC • But true filters are linear combinations of original ("span the same subspace")

STC CAVEATS

- Analysis forces filters that are 90 degrees apart!
 Filters should not be taken literally as physiological mechanisms
- Spiking in neuron may be non Poisson (bursts; refractory period; etc.)
 Filters should not be taken literally as physiological mechanisms
- There might be more filters affecting neural response than what analysis finds
- STC guaranteed to work only for Gaussian stimuli
- There might be changes that are not in the mean or variance (other approaches; e.g., info theory)

EXAMPLE: FITTING LN-LN MODEL

- Rust et al. 2005; Vintch et al. 2015)
- In Pagan et al. 2015 addressing higher level brain areas
- See also Rowekamp et al. 2017 addressing area V2

EXAMPLE: GENERALIZED LINEAR MODEL
